

Cyber Security Task 01_Anju : Personal Security Audit & Cyber Awareness Assessment

Objective - The purpose of this task is to help students understand basic cybersecurity concepts by assessing their own digital security practices and identifying potential risks. Cybersecurity starts with securing yourself before securing systems and networks.

Part A: Device Security Assessment

Security Item	Details	Status
Operating System	Windows 11 Home Single Language	Installed
OS Version	Version 25H2 (OS Build 26200.8655)	Current
Is the System Updated?	Windows 11 Version 25H2 is installed	Yes
Antivirus Installed	mcafee	Yes
Firewall Enabled	Microsoft Defender Firewall	Yes

Part B: Password Security Review

1. What makes a strong password?

A strong password is long, difficult to guess, and contains a mix of uppercase letters, lowercase letters, numbers, and special characters. It should not contain personal information like names or birthdays. Strong passwords help protect accounts from unauthorized access.

2. Why should passwords be unique?

Each account should have a different password. If the same password is used everywhere and one account gets compromised, attackers can use it to access other accounts as well. Unique passwords reduce the risk of multiple accounts being hacked.

3. What is Multi-Factor Authentication (MFA)?

Multi-Factor Authentication (MFA) is a security method that requires two or more forms of verification to log in. For example, after entering a password, the user may also need to enter an OTP sent to their phone. MFA adds an extra layer of security.

4. What are the risks of password reuse?

Reusing passwords increases security risks. If one website suffers a data breach and the password is leaked, attackers may try the same password on other accounts. This can lead to unauthorized access to email, banking, or social media accounts.

Password Policy

1. Passwords must contain at least 12 characters.
2. Passwords should include uppercase and lowercase letters.
3. Passwords must contain numbers and special characters.
4. Passwords should not include personal information such as names, birthdays, or phone numbers.
5. Users must use a unique password for each account.
6. Multi-Factor Authentication (MFA) should be enabled whenever possible.
7. Passwords should be changed immediately if they are suspected to be compromised.

Part C: Online Account Security Check

Account	MFA Enabled?	Strong Password?	Recovery Email Configured?
Google	Yes	Yes	Yes
GitHub	No	Yes	Yes
Instagram	Yes	Yes	Yes
