

Cyber Security Task 01_Anju: Personal Security Audit & Cyber Awareness Assessment

Part E: Cyber Security Awareness Poster

// SECURITY AWARENESS BRIEF - 2020

STAY SAFE

ONLINE

The Internet is a powerful tool — and a dangerous one. Every click, login, and connection carries risk. Know the threats. Build good habits. Protect yourself.

VERIFIED GUIDANCE - APPLY IMMEDIATELY

2,200+ CYBERATTACKS PER DAY GLOBALLY	95% BREACHES CAUSED BY HUMAN ERROR	\$4.45M AVERAGE COST OF A DATA BREACH
--	--	---

// CRITICAL PRACTICES

**Use Strong Passwords**

Create unique passwords with 12+ characters. Use a password manager — never reuse credentials across sites.

**Avoid Public Wi-Fi**

Public networks are hunting grounds. Use a VPN or mobile data for any sensitive activity.

**Spot Phishing Attempts**

Verify sender addresses. Hover links before clicking. Legitimate orgs never ask for passwords via email.

**Enable 2FA Everywhere**

Two-factor authentication blocks 99.9% of automated attacks. Turn it on for every account that supports it.

**Check HTTPS**

Look for the padlock in your browser bar. Never enter sensitive data on sites without SSL encryption.

**Keep Software Updated**

Outdated apps are open doors. Enable auto-updates — most breaches exploit known, patchable vulnerabilities.

// THE GOLDEN RULE

"If in doubt, don't click it. Verify first, act second."

 **Current Threat Environment**

RISK LEVEL LOW MED HIGH CRIT

Part F: Security Reflection - Answer the following:

Security Reflection

Through this activity, I identified several cybersecurity risks in my own digital habits. I realized that I do not always enable Multi-Factor Authentication (MFA) on all my online accounts. I also noticed that I sometimes use passwords that are easy to remember, which may not always be strong enough. Another risk is clicking on links or downloading files without carefully checking whether they are from trusted sources. These habits could increase the chances of phishing attacks, malware infections, or unauthorized access to my accounts.

To improve my security, I will implement several changes immediately. First, I will enable Multi-Factor Authentication on all important accounts such as Google, GitHub, and social media platforms. Second, I will create strong and unique passwords for each account by using a combination of uppercase letters, lowercase letters, numbers, and special characters. I will also avoid reusing passwords across multiple websites. Additionally, I will be more careful while opening emails, clicking links, and downloading files from the internet. Keeping my operating system and applications updated is another step I plan to follow regularly.

Cybersecurity is extremely important in today's world because most of our personal, educational, and financial activities take place online. Cyber attacks can lead to data theft, financial loss, identity theft, and privacy violations. As technology continues to grow, cyber threats are also increasing. Organizations, governments, and individuals depend heavily on digital systems and internet services. Even a small security mistake can have serious consequences. Therefore, understanding cybersecurity and following safe digital practices are essential for protecting our information, ensuring privacy, and maintaining a secure online environment.
